

CHAZ DINKLE

Site Reliability Engineer who builds AI systems end to end | Agents · MCP · Go · Python · Kubernetes

Virginia, USA (remote) | charles.dinkle@gmail.com | linkedin.com/in/chazdinkle | github.com/chazmaniandinkle | myrgic.com/chaz

SUMMARY

SRE with 15 years running production infrastructure (AWS, Azure, Kubernetes, observability on HIPAA and PCI-DSS workloads). For the past year I have built AI systems with coding agents as my main way of working, and I treat them like production: end to end, with the failure modes written down. I shipped working systems across the stack: a Go daemon that keeps an AI workstation converged on declared state, a voice and tool-use layer for agents (MCP), a phone and tablet interface where long work is handed to parallel agent threads with human approval, and a browser DAW that an agent can drive. I explain what I built, why it works, and where it breaks.

PROJECTS

Stage and Mod³: an agent you can see, hear and hand work to

github.com/myrgic/mod3

- A phone and tablet interface for my coding agent, built in days from the phone: Live2D avatar, voice in and out, a reply bubble, a side feed of every tool call, approval buttons for edits and commands, and a shared board of tasks, decisions and questions.
- Model routing and delegation: a front agent talks while parallel work threads, forked from the conversation, run builds and research and report back; stylus ink and HTML artifacts are first-class inputs and outputs.
- Mod³ is the voice layer: a local multi-engine TTS/STT server (MCP) with queue-aware speech and barge-in. Where it breaks: a repeat-call bug (agents re-issuing tool calls) is caught by a guard I wrote and still being tightened.

CogOS: a reconciler for the environment around AI tools

github.com/myrgic/cogos

- One local Go daemon: declare the state of an AI workstation (models loaded, worktrees, sites, derived views) and it converges reality toward it and reports honestly when it cannot. The Kubernetes controller pattern pointed at a desktop. I run it daily under my own agents.
- Designed for failure: an unreachable backend is Suspended, not Degraded, because a machine that is off is not something self-heal should fix. Known limits are documented in the repo. Also deploys myrgic.com, behind a pre-push disclosure scanner.

Oscine: a browser DAW an agent can drive

chazmaniandinkle.github.io/oscine · github.com/chazmaniandinkle/oscine

- No build step, no dependencies. One command catalog is driven identically by the UI, the console, a Claude MCP plugin, OSC and MIDI, so an agent edits the same surface a person does; projects store references and numbers, not rendered audio.

Also built

myrgic.com/eigen-form · myrgic.com/monengine

- eigen-form: a gallery of browser simulations where I audited my own demos for overclaims and fixed or relabelled what was wrong.
- FieldEngine and MonEngine: a game-neutral simulation engine with hash-chained, replayable run ledgers and versioned content packs; the player is public and holds no game data.
- A strip of small live tools (vector-atc, topo-asteroids, statusline-lab, screen-probe), all at chazmaniandinkle.github.io.

EXPERIENCE

Site Reliability Engineer, Orange Logic

June 2026 to present | Remote

- Site reliability and observability work for a digital asset management platform and its customer deployments.

DevOps Engineer II, Pax8

October 2025 to March 2026 | Remote

- Personal and team MCP tooling: built a local-first MCP server that indexed my own working context (tickets, notes, threads) into a queryable layer for my coding agents, and operated shared MCP servers used by the DevOps team and other internal teams.
- Disaster recovery: multi-region S3 replication, reusable Terraform modules for access logging and AWS Config remediation, failover runbooks for storage and search.
- Led the Elasticsearch 7 to OpenSearch migration (AWS SigV4, multiple accounts and regions) and moved CI to rootless-Docker ARC runners in response to security findings.
- Held the DevOps on-call rotation; took recurring patterns to weekly reliability reviews to improve monitors and runbooks.

Senior DevOps Engineer, Ruvos

September 2021 to August 2025 | Remote

- Designed a greenfield AWS platform (Terraform modules, Helm, Lambda, SQS/SNS, DynamoDB, RDS, Datadog) serving multiple healthcare providers under HIPAA; multi-region, multi-environment.
- Ran zero-downtime EKS upgrades across 12+ production clusters with a custom blue/green Terraform module.
- Python automation to migrate GitLab repositories, pipelines and registries between organizations; moved CI runners to IAM OIDC, removing long-lived static credentials.

Lead DevOps Engineer, Caterpillar Inc.

March 2020 to September 2021 | Remote

- Led decomposition of a legacy monolith into containerized services and its move onto the corporate EKS platform.
- Cut monthly AWS spend by more than 50% by moving Elasticsearch to AWS-managed OpenSearch; built the logging, metrics and tracing stack (ELK, Fluent Bit, Prometheus, Grafana, New Relic).

Earlier, Gannett | USA TODAY NETWORK; ZZ Servers; Haynes Furniture

2013 to 2020 | Virginia

- Gannett (Application Support, DevOps, 2016 to 2020): CDN operations (Fastly, Varnish) for national news properties, on-prem to AWS/GKE migration, Docker and Jenkins/Helm CI/CD. ZZ Servers (2014 to 2016): PCI-DSS hosting, Active Directory, OpenStack. Haynes Furniture (2013 to 2014): IT help desk.

SKILLS

AI and agents: Claude Code and other coding agents as primary workflow; MCP servers and clients; tool use; multi-agent delegation; model routing across local and hosted models; human-in-the-loop approvals; voice (TTS/STT)

Build: Go, Python, JavaScript (no-build browser apps), Bash, HCL; HTTP/WebSocket services; SQLite; git worktrees

Reliability and observability: Prometheus, Grafana, ELK, Datadog, New Relic, Sumo Logic, PagerDuty; SLO-minded health models; runbooks and on-call

Platform: AWS (multi-account), Azure, Kubernetes (EKS, GKE), Helm, ArgoCD, Flux, Terraform, GitHub Actions, GitLab CI, Jenkins

Data: OpenSearch/Elasticsearch, PostgreSQL, MSSQL, DynamoDB, S3

EDUCATION

Tidewater Community College: Modeling and Simulation coursework, 2009 to 2012 (no degree).
